

Some Basics Facts

This section will cover the following topics

Notation

Order of Operations

Notation

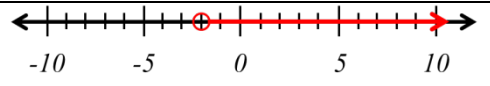

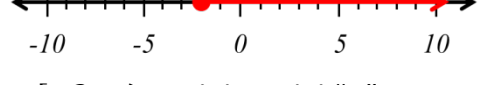

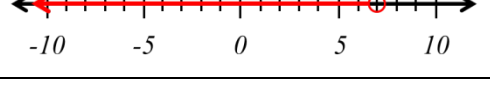

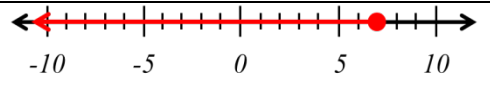

Math is a language of its own. It has vocabulary and punctuation (notation) just like any other language. To help you get ready for the placement exam, here is a list of some important notation to know.

Notation	Description												
Multiplication	<p>Multiplication can be expressed by the symbols \times, \cdot, $*$, or $()$.</p> <p>Examples</p> <table border="1"> <tr> <td>\times</td> <td>$5 \times 2 = 10$</td> </tr> <tr> <td>\cdot</td> <td>$5 \cdot 2 = 10$</td> </tr> <tr> <td>$*$</td> <td>$5 * 2 = 10$</td> </tr> <tr> <td>$()$</td> <td>$5(2)$</td> </tr> </table>	\times	$5 \times 2 = 10$	\cdot	$5 \cdot 2 = 10$	$*$	$5 * 2 = 10$	$()$	$5(2)$				
\times	$5 \times 2 = 10$												
\cdot	$5 \cdot 2 = 10$												
$*$	$5 * 2 = 10$												
$()$	$5(2)$												
Division	<p>Division can be expressed by the symbols \div, $/$, $-$, or $)$.</p> <p>Examples</p> <table border="1"> <tr> <td>\div</td> <td>$10 \div 2 = 5$</td> <td rowspan="3"> $\begin{array}{r} 5 \\ 2 \overline{) 10} \\ \underline{-10} \\ 0 \end{array}$ </td> </tr> <tr> <td>$/$</td> <td>$10/2 = 5$</td> </tr> <tr> <td>$\frac{a}{b}$</td> <td>$\frac{10}{2} = 5$</td> </tr> </table>	\div	$10 \div 2 = 5$	$\begin{array}{r} 5 \\ 2 \overline{) 10} \\ \underline{-10} \\ 0 \end{array}$	$/$	$10/2 = 5$	$\frac{a}{b}$	$\frac{10}{2} = 5$					
\div	$10 \div 2 = 5$	$\begin{array}{r} 5 \\ 2 \overline{) 10} \\ \underline{-10} \\ 0 \end{array}$											
$/$	$10/2 = 5$												
$\frac{a}{b}$	$\frac{10}{2} = 5$												
Exponents	<p>Exponents is a shortcut for multiplication. For example, 3^4 is a shortcut way of saying, "multiply 3 by itself 4 times." In other words,</p> $3^4 = 3 \times 3 \times 3 \times 3 = 81$												
Square Roots	<p>The square root symbol is $\sqrt{\quad}$. It means the number that, when multiplied by itself, results in the value inside the root. For example, $\sqrt{4} = 2$ because $2 \times 2 = 4$</p> <p>Common Roots</p> <table border="1"> <tr> <td>$\sqrt{1} = 1$</td> <td>$\sqrt{4} = 2$</td> <td>$\sqrt{9} = 3$</td> <td>$\sqrt{16} = 4$</td> <td>$\sqrt{25} = 5$</td> <td>$\sqrt{36} = 6$</td> </tr> <tr> <td>$\sqrt{49} = 7$</td> <td>$\sqrt{64} = 8$</td> <td>$\sqrt{81} = 9$</td> <td>$\sqrt{100} = 10$</td> <td>$\sqrt{121} = 11$</td> <td>$\sqrt{144} = 12$</td> </tr> </table>	$\sqrt{1} = 1$	$\sqrt{4} = 2$	$\sqrt{9} = 3$	$\sqrt{16} = 4$	$\sqrt{25} = 5$	$\sqrt{36} = 6$	$\sqrt{49} = 7$	$\sqrt{64} = 8$	$\sqrt{81} = 9$	$\sqrt{100} = 10$	$\sqrt{121} = 11$	$\sqrt{144} = 12$
$\sqrt{1} = 1$	$\sqrt{4} = 2$	$\sqrt{9} = 3$	$\sqrt{16} = 4$	$\sqrt{25} = 5$	$\sqrt{36} = 6$								
$\sqrt{49} = 7$	$\sqrt{64} = 8$	$\sqrt{81} = 9$	$\sqrt{100} = 10$	$\sqrt{121} = 11$	$\sqrt{144} = 12$								

A Quick Tip

Even if you have not done math for a long time you are likely to remember a considerable amount. Taking just a few minutes reviewing notation can help you avoid missing problems you already know.

Notation	Description		
Inequalities and interval notation	Greater Than		
	Inequality	Interval Notation	
	$x > -2$	$(-2, \infty)$	Number Line 
	Note: the ">" in $x > -2$, the "(" in $(-2, \infty)$, and the hollow "o" mean include every number bigger than -2 <i>BUT NOT</i> -2 itself.		
	For example, driving strictly faster than the speed limit may get you a ticket, but driving at the speed limit will not.		
Greater Than or Equal To			
Inequality	Interval Notation	Number Line	
$x \geq -2$	$[-2, \infty)$		
Note: the "≥" in $x \geq -2$, the "[" in $[-2, \infty)$, and the solid "•" mean include every number bigger than -2 <i>AND</i> -2 itself.			
The standard legal age for getting a driver's license is 16 or older. The age of 16 is included.			
Less Than			
Inequality	Interval Notation	Number Line	
$x < 7$	$(-\infty, 7)$		
Less Than or Equal To			
Inequality	Interval Notation	Number Line	
$x \leq 7$	$(-\infty, 7]$		
Notation	Description		

Graphing Points in a Plane

Points are written in the form of (x, y) , which is called an “ordered pair.”

The x represents the left-right distance from the center of the plane,

while the y represents the up-down distance from the center

Order of Operations

PEMDAS		Description				
1	P = Parentheses	<p>In this case, the term parentheses will include anything that would be considered a grouping symbol such as $[]$, which are called square brackets.</p> <p>Also included in this list is the fraction line. For example, in the fraction $\frac{5+3}{2+7}$ first focus on the numerator and denominator separately to get $\frac{5+3}{2+7} = \frac{8}{9}$</p>				
2	E = Exponents	<p>Exponents are a shortcut for multiplication. 2^4 means multiply 2 by itself 4 times.</p>				
3	M = Multiplication And D = Division	<p>Multiplication and Division are considered the same in the order of operations. It is important to note, however, that they should be done left to right.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%; text-align: center;">Example 1</th> <th style="width: 50%; text-align: center;">Example 2</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">$10 \div 2 \times 3 = 5 \times 3 = 15$</td> <td style="text-align: center;">$6 \times 3 \div 2 = 18 \div 2 = 9$</td> </tr> </tbody> </table>	Example 1	Example 2	$10 \div 2 \times 3 = 5 \times 3 = 15$	$6 \times 3 \div 2 = 18 \div 2 = 9$
Example 1			Example 2			
$10 \div 2 \times 3 = 5 \times 3 = 15$	$6 \times 3 \div 2 = 18 \div 2 = 9$					
4						
5	A = Addition And S = Subtraction	<p>As with multiplication and division, Addition and Subtraction are considered the same. They are also approached left to right.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%; text-align: center;">Example 1</th> <th style="width: 50%; text-align: center;">Example 2</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">$10 - 2 + 3 = 8 + 3 = 11$</td> <td style="text-align: center;">$6 + 3 - 2 = 9 - 2 = 7$</td> </tr> </tbody> </table>	Example 1	Example 2	$10 - 2 + 3 = 8 + 3 = 11$	$6 + 3 - 2 = 9 - 2 = 7$
Example 1	Example 2					
$10 - 2 + 3 = 8 + 3 = 11$	$6 + 3 - 2 = 9 - 2 = 7$					

Practice Problems

1. $3 + 4 \cdot 5 - 6$

2. $3^2 + 4 * 5 - 6 \div 2$

3. $3^2 + 4 * (6 - 2) - 5$

4. $\frac{3+5*2}{4*6-9}$

Answers

1. 17

2. 26

3. 20

4. $\frac{13}{15}$
